March 23, 2011

Revised on 12/13/2011 to Include Tensile Strength Tests

Mr. Stewart Wentworth
QUICK MOUNT PV
936 Detroit Avenue, Suite D
Concord, CA 94518-2539

Subject: New Construction Composition Mount (QMNC 3-3/4” Finished Height) Load Testing

Dear Mr. Wentworth:

As requested, Applied Materials & Engineering, Inc. (AME) has completed load-testing the New Construction Composition Mount (QMNC) hardware. The purpose of our testing was to evaluate the shear and tensile load capacity of the New Construction Composition Mount hardware attached to a commercially available 2”x4” Douglas Fir rafter.

SAMPLE DESCRIPTION

Nine (9) mockup samples were delivered to our laboratory on March 9, 2011. Mockup configuration consisted of three 16” long rafters at 7”o.c., screwed to 1/2” Structural 1 plywood. The 3-3/4” (finished height) Quick Mount Standoff (QMSO) hardware is attached through the plywood into the rafter with two 5/16”x3” lag bolts torqued to 15ft-lbs. Product hardware details are provided in Appendix B.

TEST PROCEDURES & RESULTS

1. Shear Strength Parallel to Rafter

Three samples were tested for shear strength on March 18, 2011 using a United Universal testing machine. Samples were rigidly attached to the testing machine and a shear load was applied to the 5/16”x1” machine bolt connected to the aluminum standoff. The samples were loaded parallel to rafter at a constant rate of axial deformation of 0.01 in./min. without shock until failure occurred. Based on the above testing, the average ultimate shear load, parallel to rafter, of the QMNC hardware in Douglas Fir was determined to be 1972 lbf.

The specific gravity and moisture content of the rafter was tested in accordance with ASTM D2395, Method A (oven-dry). The average specific gravity and moisture content was determined to be 0.417 and 17.4%, respectively. Detailed results are provided in Table I. Test setup and mode of failure are provided in Appendix A.
2. Shear Strength Perpendicular to Rafter

Three samples were tested for shear strength on March 18, 2011 using a United Universal testing machine. Samples were rigidly attached to the testing machine and a shear load was applied to the 5/16"x1" machine bolt connected to the aluminum standoff. The samples were loaded perpendicular to rafter at a constant rate of axial deformation of 0.01 in./min. without shock until failure occurred. Based on the above testing, the average ultimate shear load, perpendicular to rafter, of the QMNC hardware in Douglas Fir was determined to be 1466 lbf.

The specific gravity and moisture content of the rafter was tested in accordance with ASTM D2395, Method A (oven-dry). The average specific gravity and moisture content was determined to be 0.494 and 17.2%, respectively. Detailed results are provided in Table II. Test setup and mode of failure are provided in Appendix A.

3. Tensile Strength

Three samples were tested for tensile strength on June 29, 2011 using a United Universal testing machine. Samples were rigidly attached to the testing machine and a tensile load was applied to the 5/16"x1" machine bolt connected to the aluminum post. The samples were loaded in tension at a constant rate of axial deformation of 0.05 in./min. without shock until failure occurred. Based on the above testing, the average ultimate tensile load of the QMNC hardware in Douglas Fir was determined to be 3031 lbf.

The specific gravity and moisture content of the rafter was tested in accordance with ASTM D2395, Method A (oven-dry). The average specific gravity and moisture content was determined to be 0.436 and 20.9%, respectively. Detailed results are provided in Table III. Test setup is shown in Appendix C.

If you have any questions regarding the above, please do not hesitate to call the undersigned.

Respectfully Submitted,

APPLIED MATERIALS & ENGINEERING, INC.

HARWARE SPECIFICATION

PROJECT NUMBER 111114C

---

**Machine Bolt SS 5/16"x1"**

**Split Lock Washer SS 5/16"**

**Fender Washer SS 5/16"**

**Bonded Sealing Washer SS 5/16"x1 1/4"**

**Aluminum Post 1 1/4"x6.5" or 8.5"**

*(2)* **Lag Bolts Zinc 5/16"x3"**

**Aluminum Base Mount**

**Hex Bolt Grade 8 5/16"x3/4"**

---

**Instructions:**

1. Locate your desired mount placement, and mark the 2 points of penetration using the base as a template. Lags MUST penetrate into a rafter/structural member, and use holes directly opposite each other in the base plate.
2. Remove base and drill 2 pilot holes with a 7/32" drill bit. Fill the pilot holes with an appropriate sealant.
3. Place the Grade 8 Hex Bolt in the bottom of the base plate, and attach the base plate to the roof with the 2 lag bolts.
4. Screw the post onto the Grade 8 Hex bolt in the base plate. Attach the post-to-racking hardware to the top of the post for ease of location.
5. You are now ready to flash the mounts and attach racking to them.

---

**IMPORTANT-PLEASE READ:**

This product DOES NOT include flashing, and therefore is not waterproof by itself. As the installer, it is your responsibility to make sure all roof penetrations are flashed properly.

---

To whom it may concern,

Quick Mount PV offers extensive testing for all our products conducted by a third-party licensed professional engineer. All our third-party engineering reports are stamped by a licensed professional engineer at the time the reports were prepared and **do not expire**. Our engineering reports continue to be valid as long as the professional engineer’s license (date within the stamp) was valid when the reports were prepared (the report date). Even if the license has expired between the time the engineering reports were prepared and the time when a local agency reviews them, the reports do NOT need to be re-stamped with a current stamp.

This information is written into California State law under the Professional Engineers Act within the Business and Professions Code (B&P Code §§ 6700-6799). The California Board for Professional Engineers and Land Surveyors (BPELS) provides further clarification of the code in their Guide to Engineering & Land Surveying for City and County Officials, page 12 section 27, which is cited below.

27. If the license has expired between the time the engineering documents were prepared and the time when the local agency’s review is performed, do the documents need to be re-sealed by a licensee with a current license? (B&P Code §§ 6733, 6735, 6735.3, 6735.4)
As long as the license was current at the time the engineering documents were prepared, the documents do not need to be re-sealed prior to review by the local agency. However, any changes (updates or modifications) to the documents that are made following the review by the local agency would have to be prepared by a licensed engineer with a current license and those changes would have to be signed and sealed.

It should also be noted that as of January 1, 2010 professional engineers are not required to include their license expiration date when they sign and stamp engineering documents only the date that they signed the document (B&P Code §§ 6735, 6735.3, 6735.4, 6764, 8750, 8761 & 8764.5). Links to all of the codes and guides referenced in this letter may be found online at quickmountpv.com under FAQ. Please submit any further questions to tech@quickmountpv.com.

Sincerely,

Jennifer D. Alfsen, BSME
